Agile Backlog Creation & Sprint Simulation in Jira

Student Name	CHIRANTHAN HG
SRN	PES1UG24CS564
Project / Scenario	Remote Patient Vitals Alert & Monitoring
Tool Used	Jira

This document presents evidence from the Jira workspace, including the backlog, user stories, story point assignments, sprint-related work, and the burndown chart.

1. Jira Backlog with Epics and User Stories

The backlog was created for the Remote Patient Vitals scenario. The work items include patient vital monitoring functionality and related user stories such as recording, submitting, viewing, and validating vital signs.

Figure 1: Jira backlog showing user stories created for the project.

Figure 2: Backlog view showing the created work items and their organization.

2. User Story Details

User stories were written from the end-user perspective using the required Agile format: *As a [user role], I want [goal], so that [benefit]*.

Figure 3: User story details for recording and submitting vital signs.

3. Story Points and Backlog Prioritization

Story points were assigned to estimate the relative effort and complexity of backlog items. The Jira backlog also displays the assigned values and priority indicators.

Figure 4: Backlog showing story point assignments and work-item priority indicators.

4. Sprint Work and Subtasks

The selected backlog items were used for sprint simulation. Related subtasks were also created to break down user-story work into smaller activities.

The screenshot displays the 'Subtasks' modal in Jira. At the top, there's a header with a dropdown arrow, the title 'Subtasks', and icons for more options, a list view, and a plus sign. Below the header is a section for creating suggested work, featuring a star icon, the text 'Create suggested work i...', and a 'Suggest' button. A progress bar indicates '0% Done'. The main area contains a table with columns 'Work', 'P...', 'A...', and 'Status'. A single row is visible with a link icon, the text 'SE-8 Enter Vital Signs.', an equals sign icon, a person icon, and a 'To Do' status with a dropdown arrow. Below the table is a text input field labeled 'Name this subtask' with a 'Subtask' dropdown and a submit button. At the bottom, there are two buttons: 'Choose existing' with a magnifying glass icon and 'Cancel'.

Work	P...	A...	Status
SE-8 Enter Vital Signs.	=		To Do ▾

Figure 5: Subtask created under a Jira user story.

5. Burndown Chart

The Sprint Burndown Chart was generated using Story Points as the estimation field. It provides a visual comparison between remaining work and the guideline for the sprint.

Figure 6: Sprint Burndown Chart for SE Sprint 1.

6. Reflection Questions

1. Did your estimations reflect the actual effort?

The story-point estimates provided a useful relative measure of the work. During the simulated sprint, they helped in selecting and tracking work items, although a short simulation cannot fully measure real development effort.

2. Was your backlog well-prioritized?

The backlog was organized into functional work items and the core patient-vital features were selected for sprint work. Priority indicators were used to support backlog ordering.

3. How did your simulated sprint align with your plan?

The sprint simulation progressed selected work items through the Jira workflow. Jira reported completed work items, while the workspace also highlighted that any incomplete subtasks must be resolved before a sprint can be fully completed.

4. What insights did the burndown chart give about your team's capacity?

The chart shows how the remaining estimated work changed against the ideal guideline. Because this was a short simulation, there are limited intermediate progress data points, but the chart still demonstrates how sprint progress and capacity can be monitored.

Conclusion

The Jira exercise demonstrated the Agile workflow of converting requirements into backlog items, organizing work as Epics and User Stories, assigning estimates, creating sprint-related work, and monitoring progress through a Burndown Chart.
